Your Three Letter Self-Expressed Holland Code is:

A S I

Artistic Social Investigative

Score Breakdown

Click the link below to view matching occupations on O*NET Online:

<https://www.onetonline.org/explore/interests/Artistic/>

*Note: The occupations you will see on O*NET are based on every permutation of your three letter code. This is known as the rule of full exploration, which encourages you to look at occupations matching any order of your three letter code.

Understanding and Interpreting Your Results

John Holland's Theory of Vocational Choice and Personality Types

**Please note. This exercise is meant to help you explore your vocational personality type and interests. We encourage you to discuss your results with a professional career practitioner. In the event you disagree with your results we encourage you to edit your results such that they match the personality types, and order, you believe you most resemble. You can also complete Holland's Self-Directed Search, which will provide you with numerical scores for each of the six RIASEC types.*

This application utilizes Dick Bolles' (2022) Career Party Exercise, which is based on John Holland's (1997) theory of vocational choice and personality types. Holland believed:

1. Individuals can be categorized based on their resemblance to one of six personality types: Realistic, Investigative, Artistic, Social, Enterprising, and Conventional. These types are organized into what is known as the RIASEC hexagon.
2. Work environments can be categorized using the same RIASEC typology.
3. Individuals whose personality type matches their work environment type are considered to be congruent.
4. Vocational behavior can be understood by examining how individuals interact with work environments.
5. Individuals seek work that allows them to engage their personal skills, interests and values.

RIASEC Types

Realistic

Realistic types prefer working with things, rather than people. They possess strong mechanical abilities, demonstrate solid manual and physical skills, and enjoy outdoor activities. Realistic type workers occupy positions such as mechanic, farmer, and electrician.

Investigative

Investigative types prefer to work with ideas. They possess strong math abilities, demonstrate solid scientific skills, and enjoy activities that involve in-depth thought. Investigative type workers occupy positions such as biologist, doctor, and researcher.

Artistic

Artistic types prefer working with feelings. They possess strong creative abilities, enjoy activities that involve imagination, and demonstrate skills in self-expression. Artistic type workers occupy positions such as actor, writer and musician.

Social

Social types prefer to work with people, rather than things. They possess strong interpersonal abilities, demonstrate solid skills in empathic understanding, and enjoy activities that involve close personal contact. Social type workers occupy positions such as counselor, teacher and speech therapist.

Enterprising

Enterprising types prefer working with opinions, rather than data. They possess strong leadership abilities, demonstrate solid skills in presenting, and enjoy persuading others. Enterprising type workers occupy positions such as salesperson, business executive, and politician.

Conventional

Conventional types prefer working with data, rather than people. They possess strong numerical abilities, demonstrate solid organizing skills, and enjoy activities that involve planning. Conventional type workers occupy such positions as accountant, tax-preparer, and administrative assistant.

Just as individuals can be classified with a vector of resemblance to RIASEC types, work environments can be classified using the same typology. The majority of RIASEC types found within a particular work environment dictate the type of environment. Holland's (1997) theory suggests that individuals will be most satisfied if they work in an environment that fits their personality type.
